

Artificial Intelligence (AI) is a branch of computer science focused on building systems capable of performing tasks that normally require human intelligence.

These tasks include learning, reasoning, problem-solving, understanding natural language, and perception.

In recent decades, AI technology has made great strides, especially driven by advances in deep learning and the availability of big data.

AI is now widely used in healthcare, finance, education, and manufacturing.

In the future, AI is expected to further transform our lives and work through automation, personalized services, and intelligent decision-making.
